

例 6.4

$$\hat{\theta}_1 = \sum_{i=1}^n (x_i - \bar{x}) / n, \quad \hat{\theta}_2 = \sum_{i=1}^n (x_i - \bar{x})^2 / (n-1)$$

$$E(x_i) = \mu, \quad V(x_i) = \sigma^2 = E(x_i^2) - \mu^2$$

$$E(\bar{x}) = \mu, \quad V(\bar{x}) = \frac{\sigma^2}{n} = E(\bar{x}^2) - \mu^2$$

$$\begin{aligned} E(\hat{\theta}_1) &= E\left(\frac{\sum_{i=1}^n (x_i - \bar{x})}{n}\right) = \frac{1}{n} E\left(\sum_{i=1}^n x_i^2 - n\bar{x}^2\right) \\ &= \frac{1}{n} (n\sigma^2 + n\mu^2 - \sigma^2 - n\mu^2) = \frac{n-1}{n} \sigma^2 \end{aligned}$$

$$\begin{aligned} E(\hat{\theta}_2) &= E\left(\frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n-1}\right) = \frac{1}{n-1} E\left(\sum_{i=1}^n x_i^2 - n\bar{x}^2\right) \\ &= \frac{1}{n-1} (n\sigma^2 + n\mu^2 - \sigma^2 - n\mu^2) = \sigma^2 \end{aligned}$$

因此 $\hat{\theta}_2$ = 母体變異數 σ^2 的不偏估計量

$\hat{\theta}_1$ = 偏誤估計量.
